

GLOW THEORY MED SPA

GHL Automation System

Executive Summary

A complete lead-to-client automation system built on GoHighLevel (GHL) for a med spa in Scottsdale, Arizona. This document provides a high-level overview of the system's capabilities, architecture, and business impact.

Business	Glow Theory Med Spa — Scottsdale, Arizona
System	16 automated workflows on GoHighLevel
Delivery Model	Pre-built snapshot product — client purchases, activates, operates independently
Purpose	Convert inquiries into booked appointments and retain clients through automated rebooking
Date	March 2026

THE BUSINESS PROBLEM

Glow Theory Med Spa is a 3-person boutique practice in Scottsdale, Arizona — one of the most competitive med spa markets in the United States. The business generates leads through Instagram, Google, Facebook ads, and walk-ins. When someone inquires about a treatment, the front desk is often too busy with in-person clients to respond quickly. Studies show that med spa leads contacted within 5 minutes are 10x more likely to book than leads contacted after 30 minutes. Without automation, leads go cold and book with competitors.

The Challenges

Challenge	Impact
Slow lead response	Leads inquire on Instagram or Google and hear nothing for hours. They book with a competitor who responds first.
No-shows and cancellations	Booked appointments go unattended. Provider time is wasted. No systematic follow-up to reschedule.
Client lapse	After treatment, no proactive rebooking outreach. Clients forget to return. Recurring revenue disappears.
Front desk overwhelm	One person juggling check-ins, phones, and follow-ups. Manual tasks fall through the cracks.
No review system	Happy clients leave without being asked for a review. Online reputation grows slowly.
Returning client confusion	Existing clients who inquire about new treatments get treated like cold leads.

THE SOLUTION

A fully automated system of 16 interconnected workflows that handles the entire journey from first inquiry to long-term client retention — with zero leads falling through the cracks. Designed as a pre-built GHL snapshot product that any med spa can purchase, activate, and operate with a written onboarding guide.

How It Works — The Client Journey

1. Lead Capture

When a potential client fills out a contact form, submits a Facebook/Instagram lead ad, or is manually entered by the front desk, the system instantly captures their information, identifies their source and treatment interest, and creates a tracked opportunity in the Lead Pipeline. A returning client is detected automatically and routed differently — no duplicate records, no cold-lead treatment.

2. Speed-to-Lead Response

Within 1 minute of capture, the lead receives a personalized SMS and email based on their specific treatment interest. A Botox inquiry gets different messaging than a laser hair removal inquiry. The front desk is notified simultaneously. This is the single highest-ROI automation in the system.

3. Follow-Up Sequence

If the lead doesn't respond or book within 24 hours, a 3-touch follow-up sequence fires over 5 days with escalating urgency. Every message checks first: has the lead already booked? If yes, the sequence stops immediately — no embarrassing 'are you still interested?' messages after someone already booked.

4. Booking Confirmation and Reminders

When the lead books, they receive an instant confirmation with treatment-specific pre-appointment instructions. A reminder fires at 48 hours and again day-of with location and parking details. If they cancel, the system immediately offers rebooking and tracks the cancelled appointment through a dedicated pipeline stage.

5. No-Show Recovery

If a client misses their appointment, an empathetic reschedule message fires immediately with a second attempt 24 hours later. A no-show counter tracks repeat offenders — after 2 no-shows, the system stops automated outreach and escalates to the front desk for a personal call. This protects provider time from serial no-showers.

6. Post-Visit Follow-Up

After the appointment, a same-day thank you fires, followed by a treatment-specific aftercare check-in at 24-48 hours. For multi-treatment visits, both aftercare instruction sets are sent. Once aftercare is complete, a review request is triggered using a smart routing system: the client is asked to rate their experience first. Positive ratings are directed to Google. Negative ratings are intercepted and routed to the front desk before going public.

7. Rebooking and Retention

This is the highest-value automation in the system. Based on treatment type, the system calculates when the client should return (90 days for Botox, 30 days for facials, etc.) and proactively sends a rebooking reminder. If they don't rebook within the window, an escalating reactivation sequence fires: friendly reminder, special offer, then 'we miss you.' For clients lapsed 6+ months, a final win-back attempt fires with a compelling offer.

8. Referral Program

After a client demonstrates loyalty (left a review or completed 3+ visits), the system sends a referral program invitation. This happens automatically at the right moment — when the client is happiest with their results.

9. Lifecycle Management

Birthday messages with optional offers fire automatically. The Do-Not-Contact handler immediately halts all workflows when a client opts out, checks for pending appointments, and notifies the front desk. The system respects client preferences at every stage.

SYSTEM CAPABILITIES

Returning Client Detection

When an existing client inquires about a new treatment, the system recognizes them and routes them to a simplified path — no duplicate pipeline records, no cold-lead messaging. The front desk is notified with context.

Treatment-Specific Branching

Every automated message is tailored to the specific treatment the client is interested in — Botox gets different pre-appointment instructions, aftercare tips, and rebooking intervals than chemical peels or laser treatments. Each treatment branch is fully self-contained.

Smart Review Routing

The trigger link pattern asks clients to rate their experience before directing them to Google. Positive ratings go to the review page. Negative ratings are intercepted and routed to the front desk for personal follow-up — before a negative review goes public.

No-Show Protection

A counter tracks consecutive no-shows per client. After 2 no-shows, automated outreach stops and the front desk is notified for personal intervention. The counter resets on any completed visit. Prevents infinite loops and protects the provider's time.

Sequential Message Handoffs

Post-visit aftercare and review requests are sequenced — never overlapping. WF-09 handles aftercare, then hands off to WF-10 for the review request via tag handoff. The client never receives two messages at once.

Status Tag Mutual Exclusivity

A contact can only have one status tag at any time. Every workflow that changes a contact's status first removes all other status tags. This prevents tag accumulation over time and ensures conditions are always reliable.

Exit Conditions on Every Send

Every sequence workflow checks the contact's current state before sending each message. If the contact has booked, enrolled, or opted out since the sequence started, the workflow exits immediately. No outdated messages are ever sent.

Inbound Webhook Ready

A documented inbound webhook endpoint is ready to receive Facebook/Instagram lead ad data directly. The snapshot works fully without it, but clients with a marketing agency can connect it for seamless ad-to-CRM lead capture.

ARCHITECTURE AT A GLANCE

Workflows by Function

Function	Scale	Description
Lead Capture & Response	4 workflows	New lead capture, speed-to-lead response, follow-up sequence, lost handler
Booking & Appointment	4 workflows	Booking confirmation, reminders, no-show recovery, cancellation handling
Post-Visit & Retention	5 workflows	Post-visit follow-up, review request, rebooking reminder, overdue reactivation, lapsed win-back
Utility	3 workflows	Birthday/anniversary, referral program, do-not-contact handler

Two Pipelines

Lead Pipeline tracks the pre-appointment journey from first inquiry to booked appointment or lost. 7 stages: New Lead, Contacted, Engaged, Appointment Booked, Cancelled, No-Show, Lost.

Client Pipeline tracks the membership lifecycle from first visit through retention or churn. 5 stages: Active Client, Rebooking Window, Overdue, Reactivation, Churned.

Key Numbers

Metric	Detail
Active Workflows	16
Pipelines	2 (Lead + Client)
Tags	25+ across 5 categories (source, interest, status, engagement, system)
Custom Fields	10 (including no_show_count and secondary_treatment)
Treatments Supported	7 (Botox, fillers, chemical peels, facials, laser, microneedling, IV therapy)
Inbound Webhook	1 (Facebook/Instagram Lead Ad — optional enhancement)
Make.com Scenarios	0 (fully GHL-native for snapshot portability)

QUALITY AND TESTING

Every workflow was audited against documented specifications using a rigorous protocol derived from the IronPulse build methodology:

Step	Description
1	Map every action against the written specification
2	Verify all 7 Snapshot Rules (the system's inviolable architectural principles)
3	Verify Shared Principle P4 (status tag mutual exclusivity) is enforced in every status-changing workflow
4	Check cross-workflow dependencies — what feeds in, what depends downstream
5	Verify exit conditions are checked before every outbound message in every sequence workflow
6	Run scenario stress tests: returning client, no-show loop, cancel-rebook, multi-treatment, DNC mid-sequence
7	Analyze simultaneous trigger events for collision risk
8	Check for silent failures — errors that produce no visible warning
9	Audit human error vulnerabilities — what happens when the front desk makes a mistake
10	Issue final verdict

Result: 22 edge-case bugs identified during architecture audit. All fixes applied. Double-audit performed on the patched architecture — zero new issues introduced. System is production-ready.

WHAT MAKES THIS BUILD DIFFERENT

Pre-Audited Architecture

22 edge-case bugs were identified and fixed before a single workflow was built. Race conditions, duplicate messaging, infinite loops, orphaned contacts, tag accumulation — all caught and resolved during the design phase. A second audit verified the fixes introduced no new problems.

Snapshot-Ready Design

Every workflow runs on GHL-native features with zero third-party dependencies. No Make.com, no Zapier, no custom code. A med spa owner purchases the snapshot, follows the onboarding guide, and the system works on day one. The inbound webhook is a documented optional enhancement, not a requirement.

Returning Client Intelligence

Unlike most snapshot products that treat every form submission as a new lead, this system detects existing clients and routes them appropriately. No duplicate pipeline records. No 'thanks for your interest' messages to a client who has been coming for two years.

Defensive Sequence Design

Every sequence workflow checks exit conditions before every outbound message. If a lead books while in a follow-up sequence, the sequence stops. If a client rebooks while in a reactivation sequence, it stops. The system never sends an outdated or contradictory message.

Treatment-Aware Automation

This is not a generic CRM with 'appointment' as a single category. The system understands treatment types — Botox has different pre-care instructions, different aftercare, different review timing, and a different rebooking interval than a chemical peel. Multi-treatment visits are handled correctly.

Complete Documentation

This is not just a set of workflows — it is a fully documented system with a Master Blueprint (complete workflow specifications, tag structure, pipeline definitions, edge case catalog), an Executive Summary (for stakeholder review), and a Standard Operating Procedures document (the front desk daily playbook). Any GHL professional can understand, maintain, and extend it.

Full technical details are available in the Master Blueprint document, which includes complete workflow specifications, tag structure, pipeline definitions, interaction rules, and the full edge case catalog. A separate SOP document provides the front desk team's daily operational procedures.
