

GLOW THEORY MED SPA

GHL Automation System

Standard Operating Procedures

This document contains every manual task required to keep the Glow Theory automation system running correctly. It is the daily playbook for the office manager, front desk staff, and provider. Following these procedures exactly ensures that the automation works as designed.

IMPORTANT: The automation system handles most communication automatically. Your role is to perform specific manual tasks at the right time and in the right order. Skipping steps or doing them out of order will cause the wrong messages to be sent or contacts to get stuck in the system. When in doubt, refer to this document.

TABLE OF CONTENTS

1. Daily Tasks

6. Referral Program
7. When a Client Opts Out
8. Tags You Should NEVER Touch
9. Tags You CAN Use (and When)
10. Merging Duplicate Contacts
11. Common Mistakes and How to Fix Them

1. DAILY TASKS

Task	Who	When	Instructions
Check GHL task list	Front desk	Start of day	Review all open tasks. Complete or reassign overdue tasks. Tasks with no action cause leads to fall through the cracks.
Respond to internal notifications	Front desk	Throughout day	Check the GHL notification bell. Every notification requires a human action — follow up on new leads, call no-shows, respond to flagged contacts.
Monitor Lead Pipeline	Front desk	Twice daily	Check for contacts stuck in Contacted or Engaged stages for more than 48 hours. These may need a personal call.
Check for new leads	Front desk	When notified	The system sends a notification for every new lead. Review and take action if the automated follow-up needs a personal touch.
Review Client Pipeline	Front desk	Weekly	Check for clients in Overdue or Reactivation stages. These may benefit from a personal call in addition to the automated outreach.

2. HANDLING NEW LEADS

Leads That Come Through Forms (Website, Facebook Ads)

When a lead fills out a contact form or submits a Facebook/Instagram lead ad, the system handles everything automatically. Within 1 minute, the lead receives a personalized message based on their treatment interest. A 3-touch follow-up sequence fires if they don't respond. You will receive a notification that a new lead has entered the system. Your only action: review the notification and make a personal call if the lead seems high-value or has a complex question.

Leads From Phone Calls

Step	Action	Details
1	Create the contact in GHL	Enter name, phone, email (if provided). Select the treatment they asked about.
2	Submit the contact form in GHL	This triggers WF-01 automatically. The system takes over from here.
3	Book the appointment if ready	If the caller wants to book during the call, use the GHL calendar. The system sends confirmation automatically.

Walk-In Inquiries

Same process as phone calls. Create the contact in GHL and submit the form. If the walk-in books an appointment at the front desk, create the booking in GHL's calendar. The system handles confirmation and reminders from there.

Existing Client Asks About a New Treatment

If an existing client (someone already in the system) fills out a form or asks about a new treatment, the system recognizes them automatically. It will NOT create a duplicate record or treat them as a cold lead. Instead, it updates their interest and notifies you: 'Existing client interested in [treatment].' Your action: follow up personally to help them book the new treatment.

3. APPOINTMENT MANAGEMENT

When a Client Books

The system sends confirmation and pre-appointment instructions automatically — you do not need to do anything. The client receives treatment-specific instructions (e.g., 'avoid blood thinners for Botox' or 'arrive makeup-free for facials'). Reminders fire at 48 hours and day-of.

When a Client Cancels

The system detects the cancellation and automatically sends a rebooking offer. If the client rebooks within 48 hours, everything proceeds normally. If they don't, the system sends a follow-up. If they still don't rebook after 5 days total, they move to Lost. You will receive a notification if the system cannot recover the booking.

When a Client No-Shows

The system sends an empathetic reschedule message immediately, with a second attempt 24 hours later. If this is the client's second consecutive no-show, the system STOPS automated outreach and notifies you directly: 'Repeat no-show — requires personal call.' At that point, call the client personally.

IMPORTANT: The no-show counter resets automatically when the client completes a visit. You do not need to reset it manually. However, if you want to give a repeat no-shower another chance at automated outreach, you can reset the 'no_show_count' field to 0 manually in the contact record.

4. AFTER THE APPOINTMENT

When an appointment is marked as completed in GHL (this can happen automatically through your calendar integration or manually by the front desk), the system handles everything:

- Same-day thank you message
- 24-48 hour treatment-specific aftercare check-in
- Review request (sent at the right time for the treatment — 7 days for Botox, 1 day for facials)
- Rebooking reminder when the next treatment interval approaches

Your Only Actions After an Appointment

Step	Action	Details
1	Mark appointment as completed	If not done automatically by your calendar system, update the appointment status in GHL.
2	Log treatment notes (optional)	Add any relevant notes in the consultation_notes field. Useful for future visits.
3	Log secondary treatment (if applicable)	If the client received two treatments in one visit, set the secondary_treatment field. This ensures they get both aftercare instruction sets.

The Review Request System

The system asks clients if they would rate their experience 5 stars. If they click 'Yes,' they are directed to your Google review page. If they click 'No' or don't respond, the system notifies you to follow up personally. This means negative reviews are intercepted before they go public — you have a chance to resolve the issue first.

5. CLIENT RETENTION AND REBOOKING

The system tracks when each client should return based on their treatment type and proactively sends rebooking reminders. Here is what happens automatically and what requires your attention:

When	What Happens Automatically	What You Need to Do
7 days before recommended return date	System sends rebooking nudge to client.	Nothing — unless the client calls with questions.
Recommended date passes with no booking	System starts escalating sequence: friendly reminder, special offer, "we miss you" over 2 weeks.	Check Client Pipeline for contacts in Overdue stage. Consider a personal call for high-value clients.
Client inactive for 6+ months	System sends a final win-back attempt with a compelling offer.	Review Reactivation stage contacts weekly. A personal call may save the relationship.
Win-back fails	Client moves to Churned. No more automated outreach.	These contacts are done unless they re-engage on their own.

Treatment Rebooking Intervals

These are the recommended return intervals the system uses to calculate rebooking reminders:

Treatment	Recommended Interval
Botox	90 days (3 months)
Dermal Fillers	180 days (6 months)
Chemical Peels	30 days (monthly)
Facials	30 days (monthly)
Laser Hair Removal	42 days (6 weeks)
Microneedling	30 days (monthly)
IV Therapy	14 days (biweekly)

If a client receives two treatments, the system uses the shorter interval to get them back sooner.

6. REFERRAL PROGRAM

The system automatically sends referral program information to clients who have shown loyalty — either by leaving a review or by completing 3 or more visits. You do not need to trigger this manually.

If a referred friend becomes a client, you can add the engagement.referred tag to the referring client's contact to track the referral. This is optional but helps you identify your best referral sources.

7. WHEN A CLIENT OPTS OUT

When a client replies 'STOP' or otherwise opts out of messages, the system immediately halts ALL automated workflows for that contact and applies the do-not-contact tag.

If the client has an upcoming appointment, you will receive a notification: '[Name] opted out. Has upcoming appointment on [date]. Review and cancel if appropriate.' The system does NOT cancel the appointment automatically — the opt-out may be for marketing messages only, and the client may still intend to keep their appointment. Use your judgment.

IMPORTANT: Once the do-not-contact tag is applied, NO automated messages will ever be sent to this contact again. If the client later asks to be re-added, remove the system.do-not-contact tag manually.

8. TAGS YOU SHOULD NEVER TOUCH

These tags are managed by the automation system. Adding or removing them manually can break workflows, send wrong messages, or cause contacts to get stuck in the system.

Tag	Why You Should Not Touch It
Any status.* tag	Status tags are managed by workflows and must be mutually exclusive. Adding one manually can cause conflicts and wrong messaging.
Any source.* tag	Set automatically when a lead enters the system. Identifies lead origin.
Any interest.* tag	Set automatically from the inquiry form. Identifies treatment interest.
ready-for-review	Handoff tag between post-visit and review workflows. Timing-sensitive.
system.in-workflow	Collision prevention flag. Manually adding this can lock a contact out of all workflows with NO error message. If you accidentally add it, remove it immediately.

9. TAGS YOU CAN USE (AND WHEN)

Tag	When to Use
engagement.reviewed	When you confirm a client has left a Google review. This stops the review follow-up sequence.
engagement.referred	When a client refers a friend who becomes a client. Optional — for tracking.
system.do-not-contact	Only to REMOVE it — if a previously opted-out client asks to receive messages again. Never add this manually.

Fields You Can Update

Field	When to Update
consultation_notes	After any appointment — log treatment notes, client preferences, or special instructions.
secondary_treatment	When a client receives two treatments in one visit. Set BEFORE marking the appointment complete.
no_show_count	Only to RESET to 0 — if you want to give a repeat no-shower another chance at automated outreach.
referral_source_contact	When you know who referred the client. Helps track referral sources.

10. MERGING DUPLICATE CONTACTS

Occasionally, a client may end up with two contact records in GHL — for example, if they filled out a form with one email and called with a different phone number. GHL allows you to merge these contacts.

Before merging:

1. Check both contact records for active pipeline opportunities.
2. Keep the record that has the most recent activity as the primary.
3. Note any tags or field values that exist only on the secondary record — you may need to re-add them after merge.
4. After merging, verify the combined record has the correct status tag and pipeline stage.

11. COMMON MISTAKES AND HOW TO FIX THEM

Mistake	What Happens	How to Fix
Manually added a status.* tag	Conflicts with automation. Client may receive wrong messages or get stuck.	Remove the tag you added immediately. Check if the contact is in the correct pipeline stage. If messages were already sent, there is no undo.
Accidentally added system.in-workflow	Contact is locked out of all workflows. No error message shown.	Remove the tag immediately. Check if the contact missed any important workflows by reviewing their activity timeline.
Forgot to set secondary_treatment before marking appointment complete	Client receives aftercare instructions for only one treatment.	Set the field now and send the missing aftercare instructions manually.
Marked appointment complete for the wrong contact	Wrong contact gets thank you and aftercare messages. Pipeline moves incorrectly.	Cannot undo the messages. Correct the appointment status. Check the contact's pipeline stage and status tag.
Merged contacts and lost pipeline opportunity	Contact may not appear in the correct pipeline view.	Manually create the missing opportunity in the correct pipeline at the correct stage.
Client asks to be removed from messages but doesn't text STOP	System doesn't detect the opt-out automatically.	Manually add system.do-not-contact tag to the contact. This halts all workflows immediately.

When in doubt, check this document first. If you're unsure what to do, refer to the relevant section above. Getting it right the first time is always easier than fixing it after the wrong message has been sent.
